It allows you to define your own keyboard shortcuts for Windows 8 applications that do not support keyboard macros. What does this mean? You can assign a short cut key (keyboard combination) to launch an application. How do I do this? Insert and highlight your shortcut on the desired application. Go to 'Shortcut Properties' and enter the Shortcut key and the Target for that shortcut. Saving and loading user defined keyboard shortcuts is simple. To save a shortcut, go to 'Shortcut Properties' and press 'Save'. To load a saved shortcut, press the 'Load' button. How do I get more shortcuts? Look at the Keymacro folder within the 'C:\Users\Public\Documents\Keymacro'. If it is not empty, it contains shortcut templates. I want to do things like close it, minimize, and so on. I'm going to make a little menu item that will open a list of all the windows in the program and allow the user to control them, but I need to do things like close them, not just minimize. I'm also using XAML for the whole app. Thanks. A: The only way to get the window that is currently active is by accessing the current window's Owner property. There is no direct way to get a list of all active windows, and I don't think there should be one. You can access the active window through the Window.Activated event, though this will not give you the window itself. I would suggest you store a reference to the active window in a field on the main window, and bind the visibility of the close button to the field's value.
