Virtual Ghost Explorer

Virtual Ghost Explorer is an application which makes it possible to share folder structures. What this application does not want to be understood as a simple tool to exchange files with other users. Such a software can also be used to demonstrate to a friend the structure of a folder, or to share folder structures with your family or others in your network. Virtual Ghost Explorer uses a network to transfer file and folders and has easy-to-use interface. It is also free to use. Key features: * Share files or folders between different computers * Share files or folders on the network without opening the folder * Generate network snapshot of a folder * Synchronize between computers * Export files or folders * Import files or folders * Delete files or folders * Preview files and folders * Search files * Show files or folders * Change folder permissions *... Exchange services use your email messages and folders to communicate with other users. Mail servers have little control over the content that users send. That is, users can do almost whatever they want with the information in their mailbox. Your email server also needs to have a folder system that is secure enough to allow someone else to access your messages if he or she is able to guess your password. This might be no problem for someone who wants to communicate with you. But you should really not want your boss or your accountant to access your messages and even if you can prevent it, your boss can also access messages sent by other people. Virtual Ghost Explorer provides an additional layer of security over your email messages. This means that your email messages will be saved and shared by Virtual Ghost Explorer so that other people can view them. Even if someone else is able to access your messages and the server, he or she will only have access to the messages stored in Virtual Ghost Explorer and nothing else. Your message will remain safe. Further information: Virtual Ghost Explorer helps you to visualize the folders on your computer as well as your shared folders and files. What's New in the?

Virtual Ghost Explorer is an application that can remotely send a folder structure you have built to a friend. Of course, it can also be used for much more. The program lets you share the contents of a directory with other users without them being able to access the original files. Also, you can replicate a folder structure, which means that you can create a full copy of the folder's contents without actually copying it to the target location. Does what it says on the tin and it does it well. It's fast and user friendly, the only real issue I have with it is that it doesn't allow folder locking (as far as I can tell). A few other applications, such as Recuva, do but if you're looking for a freeware tool that allows you to browse or view the contents of a folder remotely then I think Virtual Ghost Explorer is worth a go. Overview: This is a great tool for recovering deleted files, even from a recent Hard drive crash. I think I could pick up something in the log files that would point to the cause of the crash. I would have to see the log file first to see if there is anything in there. Also, when a "new partition" is created to replace the damaged hard drive, a file of that size is written to that new partition. This new file then would have a completely different CRC than the old file that was deleted. But I will test it first. I have used this before and it did work for me. Overview: Recover deleted files by using easy and effective applications. Use this software, which is easy-to-use and easy to learn and understand. Also, recover deleted files for free. Even if you can't find any data on your computer, you can still recover some lost data in your computer by using this program. Recover files and folders easily with PhotoRec.
